WORK EXPERIENCE

Move Industries **Remote**
Forward Deployed Engineer *October 2024 – Present*

- Integrated Circle's USDCx stablecoin on Movement, working with Circle's engineering team from technical scoping through production launch.
- Built Zoth's tokenized-vault integration end-to-end in Move, from requirements to deployed smart contracts.
- Shipped stablecoin integrations with Sorted Wallet and Stableyard, supporting their payments products for emerging markets.
- Own integrations for 10+ fintech and blockchain partners across pre- and post-sales, from scoping and proofs of concept to production code, feeding partner needs back to product.
- Delivered SDK and tooling integrations with partner engineering teams, troubleshooting implementation issues in their code and supporting them through deployment.

Injective Labs **Remote**
Developer Relations Manager *February 2024 – October 2024*

- Guided developer teams building on Injective through implementation and debugging, and wrote tutorials and implementation guides for platform APIs and tooling.
- Delivered technical workshops for engineering audiences at global industry events.

Sui Foundation **Remote**
Developer Relations Engineer *January 2023 – February 2024*

- Troubleshot technical issues for ecosystem developers onboarding applications to Sui, and wrote documentation and tutorials on platform tooling and developer workflows.
- Turned recurring developer pain points into documentation, tooling, and onboarding fixes with internal teams.

AI PROJECTS

Nope **github.com/shayansanjideh/nope**
Security proxy for AI agent tool calls (MCP) *2026*

- Drop-in MCP proxy that tracks where data came from on agent tool calls: secrets can't leave the machine, and untrusted content can't trigger a push, deploy, or config edit without user approval.
- Enforcement core is proven correct in Lean 4, and the proven code is the engine that ships.
- No false blocks in normal use: 40 of 40 tool calls passed across 8 everyday Claude Code tasks.

Learning Inference **github.com/shayansanjideh/learning-inference**

- Replaced .generate() with a custom prefill/decode loop for SmolLM2-135M, matching its output tokens.
- Measured ~4.3× faster generation with KV caching; benchmarked prefill and decode separately.

Neuron Lab **github.com/shayansanjideh/neuron-lab**

- Served Qwen3.5-4B via FastAPI and steered individual neurons; the target trait showed up in up to 28/32 replies vs. 0/24 with random neurons.
- Built a blind Claude Code judge and pre-registered tests, and published the results that didn't reproduce.

TECHNICAL SKILLS

Languages: TypeScript, Python, Rust, Move, Solidity, Lean 4
AI: AI agents, MCP, LLM inference and serving, KV caching, Claude Code
Infra: AWS, GCP, Docker, FastAPI, REST APIs, PostgreSQL, CI/CD (GitHub Actions), Linux, GPU inference
Engineering: API and SDK integrations, debugging customer code, technical docs, full-stack, PoCs

EDUCATION

Virginia Tech **Blacksburg, VA**
Bachelor of Science in Mechanical Engineering *May 2022*
