AI PROJECTS

Nope **github.com/shayansanjideh/nope**
Formally verified permission layer for AI agents *2026*

- Drop-in MCP proxy that tracks where data came from on agent tool calls: secrets can't leave the machine, and untrusted content can't trigger a push, deploy, or config edit without user approval.
- Proved noninterference in Lean 4: secrets can't influence outbound calls and injected content can't trigger protected actions, whatever the model does; the proven code is the shipped engine.
- Stays out of the way for normal work: 40 of 40 tool calls went through with zero blocks across 8 everyday Claude Code tasks.

Learning Inference **github.com/shayansanjideh/learning-inference**

- Replaced .generate() with a custom prefill/decode loop for SmolLM2-135M, matching its output tokens exactly.
- Measured ~4.3× faster generation with KV caching (64-token prompt, 32 output tokens); benchmarked prefill and decode separately across prompt lengths.

WORK EXPERIENCE

Move Industries **Remote**
Forward Deployed Engineer *October 2024 – Present*

- Integrated Circle's USDCx stablecoin on Movement, working with Circle's engineering team from technical scoping through production launch.
- Built Zoth's tokenized-vault integration end-to-end in Move, from requirements to deployed smart contracts.
- Worked with Sorted Wallet and Stableyard on stablecoin integrations and adoption, including payments products for emerging markets.
- Own integrations for fintech and blockchain partners across pre- and post-sales, from scoping and proofs of concept to production code, feeding partner needs back to product.

Injective Labs **Remote**
Developer Relations Manager *February 2024 – October 2024*

- Guided developer teams building on Injective through implementation and debugging, and wrote tutorials and implementation guides for platform APIs and tooling.
- Designed and ran technical hackathons, evaluating submitted implementations and turning developer feedback into onboarding and tooling improvements.
- Delivered technical workshops for engineering audiences at global industry events.

Sui Foundation **Remote**
Developer Relations Engineer *January 2023 – February 2024*

- Troubleshot technical issues for ecosystem developers onboarding applications to Sui, and wrote documentation and tutorials on platform tooling and developer workflows.
- Turned recurring developer pain points into documentation, tooling, and onboarding fixes with internal teams.

TECHNICAL SKILLS

Languages: Rust, TypeScript, Python, Move, Solidity, Lean 4
AI: AI agents and agent security, MCP, Claude Code, LLM inference, formal verification
Engineering: API and SDK integrations, smart contracts, full-stack development, technical troubleshooting, proof-of-concept development, developer tooling
Customer-Facing: Technical discovery, solution scoping, partner onboarding, implementation support, pre-sales and post-sales engineering

EDUCATION

Virginia Tech **Blacksburg, VA**
Bachelor of Science in Mechanical Engineering *May 2022*
